## COMPREROSS RO/DY MOD

Rev.5.Mar.13.2002

When there's a board that can be populated as two very famous effects, the question always is "which effect should I build on this board?" To help with this issue, here's a mod that involves adding a 4 pole double throw toggle switch so that you don't have to make that decision. Populate the board with the resistors for the Rosscomp, but leave the capacitors out. Instead, solder wire leads to the pads marked on the layout below. Take the switch and solder the caps to it, all the negative leads of the electrolytics go to ground, and the positives go to the respective poles. Switch ON: you get Ross, Switch OFF: Dyna. MXR and Dynacomp are registered trademarks owned by Dunlop.
